

The Apple Tree and Gravity

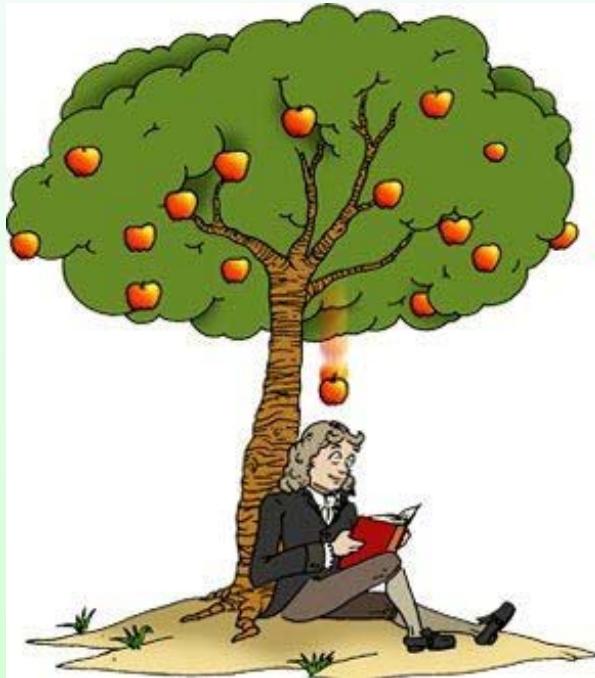

The great physicist, Isaac Newton, loved to study and think under a tree. One day, while he was reading under an apple tree, an apple suddenly fell on his head. In a stroke of brilliance, he discovered the principle of universal gravitation.

Many may think that Newton discovered the principle of universal gravitation easily because of the falling apple. However, the discovery did not prove to be that simple. In fact, Newton spent a lot of time reflecting on the concept. The falling apple might have inspired him to create a new theory.

The Apple Tree and Gravity

Food for Thought:

Innovation does not depend on inspiration alone, but also on continuous efforts in studying and thinking repeatedly on the related topics, which will eventually lead to the needed solutions.
